

## Health Care and Nursing Simulators

Our virtual case-based simulations provide an environment for meaningful, on-demand, discovery-based learning of crucial health-care expertise in controlled settings in which users can practice and refine an array of skills, including critical thinking, decision making and differential diagnostics.

The technologies overcome a host of challenges in both the near and long-term future of medical education that will decrease opportunities for clinical experiences. Virtual case-based simulations are ideal to induce critical thinking and develop differential diagnostic skills. Immersion is an established learning strategy for complex content such as medicine.

*Virtual case-based Simulators are perfect learning environments and assessment tools!  
Students are being assessed every moment!*

### We believe our success is attributable to following core competencies:

- Taking advantage of our previous experience in the designs of highly attractive simulators for different industries, learning, and assessment.
- Technology diagnostic: our technology preferences are based on our client constraints (development schedule, project cost, and deployment platform) and performance metrics.
- Supporting data collection, reporting and presentation with game and simulation products purposefully designed and instrumented for research, education and assessment.
- More than 15 years of experience, today we have multiple platforms with health care organizations around the world. Healthcare accounts represents for 70+% of our business.

The Simulators are mounted on a platform that includes numerous product families and focus areas.

### Platforms:

**vHealthCare™** a simulation platform that supports today's teaching and assessing techniques which guides learners to construct knowledge through active problem solving within a relevant context. Modern research shows that lifelong learning and critical thinking occur by placing students in the center of learning, by tailoring teaching to individual needs and connecting knowledge to hands-on experience.

Medical professionals are also aware that real-life experience is mandatory in acquiring the requisite physical and intellectual skills of clinical practitioners. Simulation is an emerging key theme affecting teaching and learning. Our simulation platform **vHealthCare™** medical simulation development platform is a strategic part of this learning shift. As an educational application, it provides a realistic problem context where students take on clinical roles, apply medical concepts and principles and do it in a virtual environment.

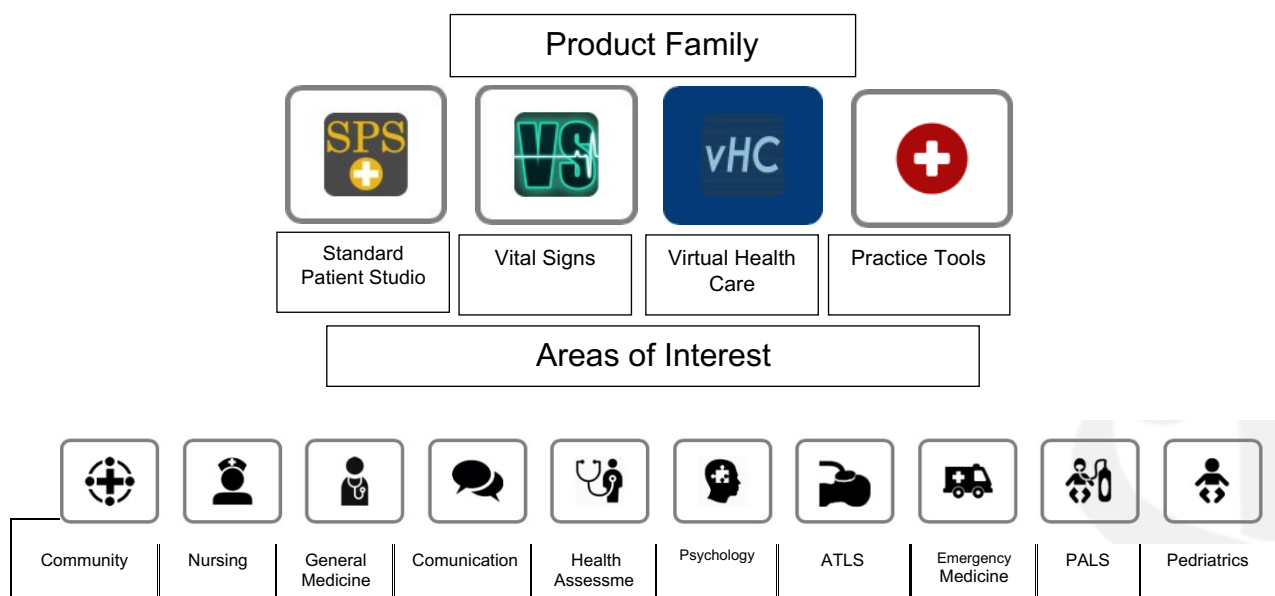

Con **vHealthCare™**  
se pueden obtener  
créditos de:

**vHealthCare™** is a dynamic immersive virtual learning space for students and practitioners in health care. It provides a lifelike, interactive environment for the health care professional that incorporates discovery, analysis, interpretation, performance, and problem solving. Along with hands-on experience, students can take command of their education through self-testing and assessment within the program. The program will also allow educators to guide students by detailed individual assessment.

Students will be able to access **vHealthCare** and take advantage of clinical experiential learning, anytime, anywhere. Users may include nursing and health professionals, first responders, and emergency response personnel.

The content of the portal can be classified by Product Family and filtered by Areas of Interest such as:

## Vital Signs™ Simulator

Vital Signs is a single participant designed to recreate the stress and confusion of the Emergency Department to assess user decision making under stress. Vital Signs has been validated independently by researchers as achieving physician behaviors and outcomes consistent with real world practice.

The student must diagnose, stabilize and make discharge decisions for multiple simultaneous realistic patient simulations under time pressure. While making critical care decisions the student must also deal with different minor events designed to increase their stress and better simulate the distracting and hectic environment of an emergency room.

## Vital Signs Simulator, ER (Grouped by Type of Case)

#	CASES	COURSE TYPE	DESCRIPTION
1	Subdural Hematoma	Older Adult Cases Course Code VSEDS2320Z2	This scenario involves a mix of older adult patients (58-yo plus) who present to the ED with different issues. These issues include headache, hypertension, CHF, rectal bleeding, fractures, head injury, and life-threatening injury sustained in a vehicle accident. As the doctor on shift, you are responsible for initial treatments, deciding the primary and differential diagnoses, and disposition of the patients from the ED
2	Fractures, 01		
3	Fractures, 02		
4	Fractures, 03		
5	Chronic Heart Failure		
6	Hypertension		
7	Musculoskeletal		
8	Arteriovenous Malformations		
9	Aortic Transection		
10	Sepsis, 01	Infection Cases Course Code VSEDS3320Z3	This scenario focuses on patients arriving at the ED with a variety of symptoms such as fever, pain, and weakness of limbs that suggest infections. Their ailments include sepsis, febrile seizure, cellulitis, osteomyelitis, appendicitis, neonatal fever, and transient synovitis. As the doctor on shift, you are responsible for initial treatments, deciding the primary and differential diagnoses, and disposition of the patients from the ED.
11	Sepsis, 02		
12	Cellulitis

## Virtual Doctor Visit Simulator

The culmination of years of virtual human and medical simulation research is an online virtual standardized patient solution.

The SPS, is capable of rich, natural language interactions between learners and Virtual Standard Patient. The project addresses medical interviewing and diagnostic skills and includes a sophisticated assessment (AI system). We believe that these technologies can accelerate condition specific diagnostic skills, improve patient safety and provide an objective assessment standard.

The SPS demonstrated >68% case performance gains after 20 minutes of use, 92% recognition & 96% accuracy for medical interview natural language, and automatic medical performance assessment accurate within 5% as compared with trained human evaluators.

## **vHealthCare™: Virtual Pediatric Simulator (VPS)**

The VPS is a Simulator that teaches the core decision making skills needed to manage seven high-stakes pediatric emergency medicine cases. It is designed for medical students, residents, physicians and medics in both the civilian and defense sectors.

A 10 year-old child with a history of peanut allergy is brought to the ED for evaluation of difficulty breathing and vomiting 20 minutes after accidentally ingesting peanuts.

The student is the treating physician and is placed in a first-person perspective in an emergency room setting. Throughout each scenario, the student must make the appropriate assessments and provide the appropriate treatments to stabilize the patient. Students learn the unique aspects of managing critically ill children including vital sign interpretation and differences in equipment sizes and medication dosages.

The simulator records the performances on each scenario and provides individualized feedback to the student.

The VPS was demonstrated excellent discriminant validity among subspecialty attendings, pediatric residents, and medical student who were evaluated before and after the simulator.

vHC

## vHealthCare™ Simulator, Scenario

#	SCENARIO	MAX POINTS	DESCRIPTION
1	Anaphylactic Shock	80	<p>In this scenario, a child presents to the ED in anaphylactic shock after eating peanuts. The patient is in respiratory distress with wheezing, has facial swelling and is hypotensive.</p> <p>This scenario is designed to train and assess learners on the assessment and treatment steps for a child in anaphylactic shock including intravenous fluid (IVF) administration, the use of bronchodilators, the proper dosing of intramuscular epinephrine and the use of other medications such as antihistamines and steroids.</p> <p>The scenario follows current recommendations for the treatment of anaphylactic shock [The diagnosis and management of anaphylaxis practice parameter: 2010 update. Lieberman P, et al. J Allergy Clin Immunol 2010; 126(3):477-80].</p>
2	Septic Shock	116	<p>The septic shock scenario, a child presents to the ED in septic shock. The patient is obtunded, hypotensive and displays a characteristic meningococcal rash.</p> <p>The scenario is designed to train and assess learners on the assessment and treatment steps for a child in septic shock including oxygen administration, aggressive IVF administration, antibiotic administration and the administration and proper dosing of vasopressors. In this scenario, attempts at IV access fail and the learner must select between the proper next step of placing an intraosseous line or the improper next step of attempting to place a central venous catheter.</p> <p>The scenario teaches and reinforces the Surviving Sepsis guidelines [Surviving Sepsis Campaign: international guidelines for management of severe sepsis and septic shock, 2012. Dellinger RP, et al. Intensive Care Med 2013; 39(2):165-228.]</p>
3	Seizure and Apnea	64	<p>In the seizure and apnea scenario, a child presents to the ED actively seizing. The patient has a partially obstructed airway due to vomit and is hypoxic.</p> <p>The scenario is designed to train and assess learners on the assessment and treatment steps for a child with respiratory insufficiency, partial airway obstruction and seizure activity.</p> <p>In this scenario, the learner must choose to assess and suction the airway, perform bag-mask ventilation and administer an anti-seizure medication. The proper sizes of equipment (resuscitation bag size, mask size) must be selected as well as the proper rate at which to perform the bag-mask ventilation.</p> <p>The scenario follows the assessment and treatment recommendations as presented in the PALS Provider Manual [AHA/AAP Pediatric Advanced Life Support Provider Manual, 2011 Edition, American Heart Association, Dallas, TX].</p>

## Scenario, continued

#	SCENARIO	MAX POINTS	DESCRIPTION
4	Respiratory Failure	77	<p>In the respiratory failure. The infant is wheezing, demonstrating periods of apnea and is hypoxic.</p> <p>The scenario is designed to train and assess learners on the assessment and treatment steps for an infant in respiratory failure. In this scenario, the learner must choose the proper sizes of equipment to perform bag-mask ventilation (resuscitation bag size, mask size) followed by selecting the proper sizes of equipment for tracheal intubation (endotracheal tube size, laryngoscopeblade size).</p> <p>The proper depth of tube placement must be selected. In this scenario, the learner has the option of providing rapid-sequence intubation medications to the patient. If utilized, appropriate RSI medications and doses must be selected. The scenario follows the assessment and treatment recommendations as presented in the PALS Provider Manual [AHA/AAP Pediatric Advanced Life Support Provider Manual, 2011 Edition, American Heart Association, Dallas, TX].</p>
5	Bronchiolitis	70	<p>In the bronchiolitis scenario, an infant present to the ED with mild bronchiolitis. The patient is wheezing and is minimally distressed but not hypoxic. This scenario is designed to train and assess learners on the assessment and treatment steps for an infant with mild bronchiolitis. These steps include an initial airway, breathing and circulation assessment.</p> <p>The scenario is designed to teach the current recommendations from the American Academy of Pediatrics regarding the assessment and treatment of bronchiolitis which discourage testing and discourage the use of bronchodilators and steroids for infants with bronchiolitis. [Clinical Practice Guideline:</p> <p>The Diagnosis, Management, and Prevention of Bronchiolitis. Ralston SL, et al. Pediatrics 2014; 134:e1474-e1502]. Learners lose points in this scenario for obtaining tests or administering bronchodilators or steroids.</p>
6	Diabetic Ketoacidosis (DKA)	62	<p>In the DKA scenario, a child presents to the ED with altered mental status.</p> <p>The scenario is designed to train and assess learners on the assessment and treatment steps for a child with altered mental status including the rapid recognition of DKA through focused laboratory testing including bedside glucometer testing.</p> <p>The scenario follows the current recommendations on treating children in DKA which emphasize limited IVF bolus administration and not administering insulin boluses or sodium bicarbonate. [Rosenbloom AL. The management of diabetic ketoacidosis in children. Diabetes Ther 2010 Dec; 1(2):103-20].</p>

#	SCENARIO	MAX POINTS	DESCRIPTION
7	Supraventricular Tachycardia (STV), Stable	96	In the SVT case, an infant present to the ED in SVT. This scenario is designed to train and assess learners on the assessment and treatment steps for an infant in SVT including the initial assessment steps to determine that the patient is stable (pulse check, heart rate, blood pressure checks). The learner must decide on the best initial treatment for this patient which is to perform an ice pack to the face vagal maneuver. The learner must decide against improper vagal maneuvers (carotid massage, ocular pressure). When the infant fails to respond to the ice pack maneuver, the learner must decide on the next step which is to administer adenosine using a two-syringe technique.
8	Supraventricular Tachycardia (STV), Unstable		<p>In the second half of the SVT case, the patient becomes unstable (altered mental status, poor perfusion, hypotension). The learner must decide on the next appropriate step in treating the patient which is to perform synchronized cardioversion.</p> <p>The learner must decide on the correct dose and the proper synchronized mode to perform the cardioversion. The scenario follows the assessment and treatment recommendations as presented in the PALS Provider Manual [AHA/AAP Pediatric Advanced Life Support Provider Manual, 2011 Edition, American Heart Association, Dallas, TX].</p>
Total		565	

#### VPS Scoring Tool:

VPS records the log of each case and displays the actions and times during the exercise. In addition, it includes a summation tool which keeps track of all scores awarded in the scenarios for results. Likewise, points are deducted for performing dangerous acts such as wrong medication, incorrect administration of IV fluids, and others.

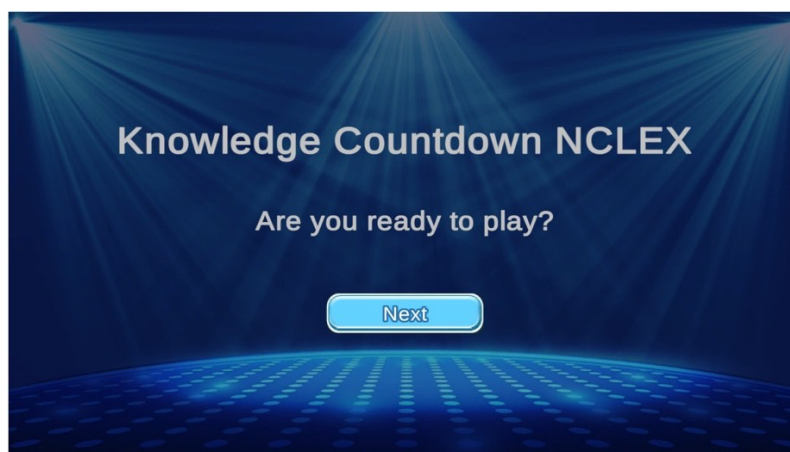

The metrics used suit the PALS provider manual as well as the referenced authorities that were used for the development of the scenarios.

## Practice Tools Simulator

It contains a wide variety of simulation learning content that covers different topics such as:

- Community health brigades with an emphasis on immunization and infectious diseases
- Health research brigade in large communities
- NCLEX knowledge questions from the National Council of State Boards Nursing

Categories:    

**Sick middle schooler**  
A student from this middle school was sent home with a severe cough.  
Located at: Educational building in Greentails.  
☒ MARK AS IMPORTANT?

**Observations**

- Quarantine successfully completed
- Quarantine cases closed
- New cases detected
- Check on Senior Care
- Check on Senior Care
- Check on Senior Care

*In this scenario, you will investigate the town of Loggerton, a community of 100,000 people. Your mission is to ascertain what community health needs this large community might have. There are several potential preventions that could be undertaken in the community, but it is up to you to observe and investigate what problems exist and how to best address the issues that present themselves.*

*The Loggerton mission is complex in that there are many different issues to uncover, although you may only focus on one or two preventions. That being said, Loggerton has a good number of observations and a good deal of information to uncover. Average time to complete this mission is approximately 120 minutes.*
